

Security & Governance

Module reference -- ADAR Knowledge Academy -- Agonomia Labs Product Tour

ADAR's security model has three layers: how a person proves who they are, what their role lets them do once they're in, and what the platform does automatically at runtime to limit blast radius. This page also explains the model behind the guest session you are using right now.

Identity and access

Figure 1. Email-MFA sign-in, workspace role hierarchy, and the four runtime guardrails.

Sign-in with email MFA

A normal DocIntel login is email and password, verified server-side, followed by an optional second factor: a 6-digit, time-limited code emailed to the account and checked against a short-lived MFA token before a real access token is issued. No password is ever stored or logged in plaintext, and a code that fails to verify never issues a session.

Workspace roles (RBAC)

Role	Can do
Owner	Full control: billing, membership, delete the workspace

Editor	Create and manage courses, documents, and content mappings
Viewer	Read content and use the guided AI tools (Tutor, Study Tools) -- cannot edit

This guest preview session runs with a **viewer** role -- the same role a real enrolled student has -- inside a workspace scoped to exactly one published course. It can read and ask the AI Tutor questions; it cannot edit or manage course content.

Runtime guardrails

- **PII redaction** -- an optional pass that strips personally identifiable information before content is stored or sent to a language model.
- **Usage governance** -- per-plan limits on documents, storage, and API calls, enforced on the server, not just in the UI.
- **Audit log** -- every mutating action is recorded with its actor, IP address, and resource, independent of application logs.
- **Guest isolation** -- this public demo creates one ephemeral, expiring viewer-role user per visitor, with no login path, no password, and a hard cap on questions and generations. Closing this tab (or the session expiring) is enough to end it; there is nothing to log out of.
