

A market-ready agentic platform. **Nine industries in production.**

Built for enterprises of any size.

Agomonia Labs runs ADAR — a stable, multi-tenant agentic AI core that turns ungoverned enterprise documents, conversations, and video into evidence-backed decisions. The platform is live in production across nine domain-specific products spanning healthcare, talent, finance, restaurants, real estate, and sports. The next phase is deliberately narrow: enterprise client outreach, and extending the integration layer — SSO, HRIS/ERP, ITSM, CRM — that enterprise buyers already require.

- 9 industry verticals live in production today
- 1 unified agentic core — ADAR — behind every product
- 5 languages supported in production: English, Spanish, Bengali, Hindi, Arabic
- 4 pillar enterprise architecture: Agentic, Data, Access, Reasoning

THE PROBLEM

Enterprises are drowning in unstructured content — documents, calls, videos, forms — and most “AI adoption” so far is a generic chatbot bolted onto a search box. That doesn’t hold up where decisions need evidence, domain rules, and an audit trail: hiring, clinical intake, tax review, lease obligations, prior authorization.

“Organizations do not need one more generic chatbot. They need AI systems that understand governed enterprise content, retrieve exact evidence, call tools, follow domain rules, produce structured outputs, and leave an audit trail.”

THE SOLUTION

ADAR is the stable, reusable core behind every Agomonia Labs product: specialist agents, unified data access, governed retrieval, and structured reasoning. The same orchestration and audit layer that powers a healthcare scribe today powers a talent-readiness workflow tomorrow — we swap the agents and tools, not the foundation. That reusability is why nine verticals are already stable in production, and why extending into the SSO, HRIS/ERP, and ITSM integrations enterprise buyers ask for is a fast follow, not a rebuild.

THE ADAR ARCHITECTURE

- A**
Agentic
Specialist agents coordinate work instead of one model answering alone — routed to focused agents for documents, tools, web, and databases.
- D**
Data
A unified layer blends private knowledge with live operational data — files, video, OCR, transcripts, SQL, and APIs.
- A**
Access
Natural conversational access with RBAC, audit trails, and text or voice — ADAR reaches the right systems for the user.
- R**
Reasoning
Grounded answers become structured decisions — retrieved evidence synthesized into summaries, scores, and actions.

NINE PRODUCTS, ONE PLATFORM

- DocIntel**
Document, speech & video intelligence — hybrid retrieval, grounded chat, citations, summaries.
- Talent Management**
Resume-to-role matching, evidence matrices, interview validation, and employee mobility readiness.
- Healthcare**
Clinical scribe (SOAP notes, after-visit summaries) and prior-authorization evidence workflows.
- Finance & Tax**
Classifies financial documents into tax organizers, planning snapshots, advisor-ready packets.
- Restaurant AI**
Menu capture, voice search, and Stripe-paid carryout ordering from one deployment.
- ADAR Front Desk**
Voice & chat appointment scheduling with live availability across multiple locations.
- Video Intelligence**
Trainings, meetings and recordings become searchable, timestamp-aware knowledge.
- Lease Intelligence**
Extracts lease parties, terms, obligations and renewal risk with citations.
- ADAR Sports & Geetabitan**
Multilingual cricket league assistant; Bengali music discovery by lyric, raga and mood.

THE ENTERPRISE INTEGRATION LAYER

- MCP INTEGRATION — LIVE**
Model Context Protocol access already lets AI assistants, agent frameworks, and automation platforms plug straight into ADAR.
- IDENTITY & ACCESS — EXTENDING**
SSO/SAML and RBAC extensions so ADAR drops into an enterprise’s existing identity stack.
- HRIS, ERP & ITSM — EXTENDING**
Direct connectors into the systems of record talent, finance, and operations teams already run.

WHERE THIS GOES

NEXT ~6 MONTHS

Land the first enterprise customers

- Direct client outreach to sign the first mid-to-large enterprise customers as proof points in 2–3 anchor verticals (DocIntel, Talent Management, Healthcare)
- Stand up the customer success & support team needed to onboard and service them reliably
- Ship the first priority enterprise integrations (SSO/SAML, HRIS/ERP, ITSM)

6–18 MONTHS

Extend the integration layer

- Broaden the enterprise integration surface — CRM, data warehouses, ticketing — via MCP Integration and direct connectors
- Scale outbound client outreach across the remaining live verticals
- Grow customer success & support alongside the expanding account base

18–36 MONTHS

Own the category

- Position ADAR as the governed reasoning layer enterprises standardize on for domain AI
- Land multi-vertical enterprise accounts on a single platform contract
- Underwrite a Series A on proven, referenceable enterprise accounts

THE ASK

\$2.5M Pre-Seed

~20 months of runway
to prove the market-ready product with real enterprise accounts

35%

CLIENT OUTREACH & GTM

Direct enterprise outreach to land the first mid-to-large customers as proof points in 2–3 anchor verticals.

35%

ENTERPRISE INTEGRATIONS

Extend the integration layer — SSO/SAML, HRIS/ERP, ITSM, CRM — enterprise buyers already require.

30%

CUSTOMER SUCCESS & SUPPORT

Build the support team to onboard and service the first mid-to-large enterprise accounts reliably.

This round is sized to land **the first mid-to-large enterprise customers** as proof points, build the **support team** to service them, and extend the **enterprise integration layer** needed to close the next wave — underwriting a priced seed round.

WHY NOW

PILOTS → PRODUCTION

Enterprise AI budgets are shifting from experimentation to systems that have to actually run in production — buyers now ask for governance, not just chat.

VERTICAL BEATS HORIZONTAL

Domain-specific agents are outcompeting generic tools wherever rules, evidence, and audit trails determine whether a decision holds up.

DISTRIBUTION IS PROTOCOL-NATIVE

MCP and agent-to-agent standards are becoming how enterprises plug new AI capability into what they already run — exactly how ADAR is built to distribute.

Why This Wins

- **Stable, not experimental.** Nine verticals already run in production on one reusable core — the platform risk is retired before this round.
- **Governance as the moat.** Citations, traces, RBAC, and audit history are built into the core, not bolted on for compliance later.
- **Cross-media by default.** Documents, audio, and video already share one ingestion and retrieval layer.
- **Integration-ready today.** MCP Integration already plugs ADAR into customers' existing AI stacks — extending to SSO, HRIS/ERP, and ITSM is the next fast follow, not new architecture.

Team

Founder-built and hands-on end to end. Braja has personally built and shipped every layer of the ADAR platform — agent orchestration, retrieval, backend, frontend, and cloud infrastructure — across all nine live verticals.

Google ADK multi-agent architecture · FastAPI on Cloud Run · React/Vite on Firebase Hosting · Firestore · Google Cloud Platform

Next hires: enterprise integrations engineering, and the customer success & support team to onboard and service the first mid-to-large enterprise accounts.

Let's build the governed reasoning layer enterprise AI runs on.

Agonomia Labs · Intelligence. Intent. Impact.
